# 构建TableView

——理解IOS UI编程

主要内容:

• UIKit框架理解

构建TableView

• 定制视图控制器DZTableViewController

• TableView可扩展性探讨

#### 讨论:

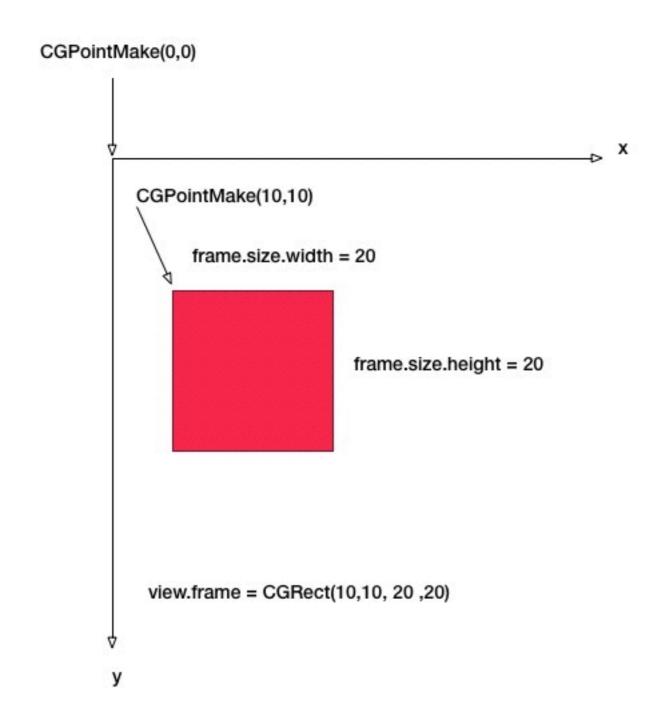

- 1. 一个UI库可以看成是我们在计算机上对现实世界的一次模拟,那么UIKit的这种模拟在你脑海中是个什么样子?
- 2. 假设让你来做这样的一种模拟,你认为应该用什么样的一个模型?

3. 而如果在UIKit基础上做一个TableView呢?

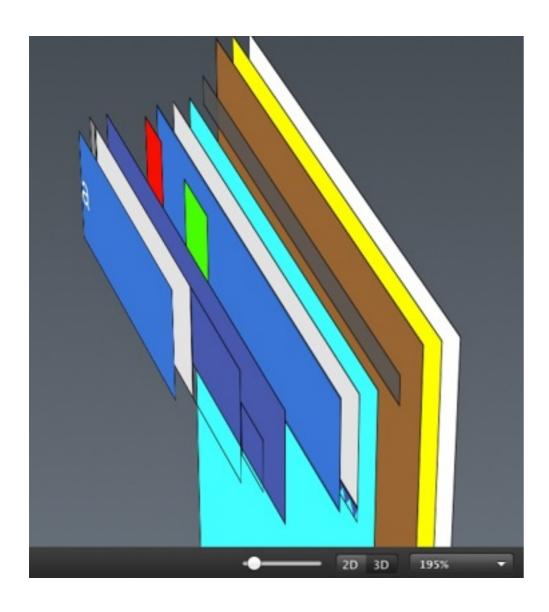

#### 布局

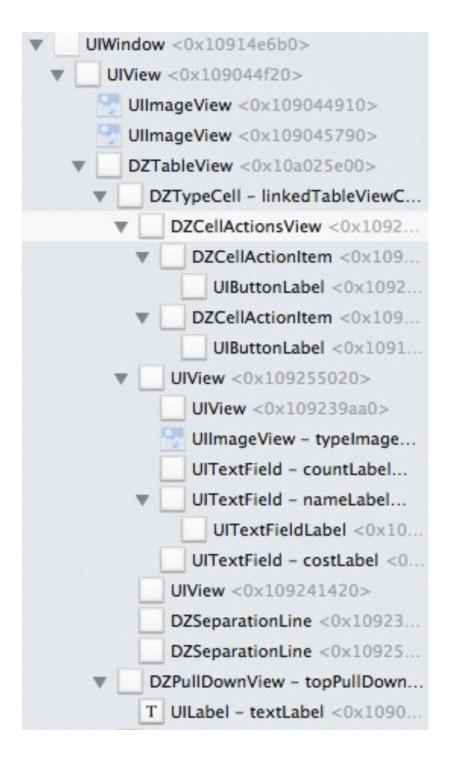

- 平面布局模型(几何布局)
- 三维布局模型 (Z-order)

# 几何布局

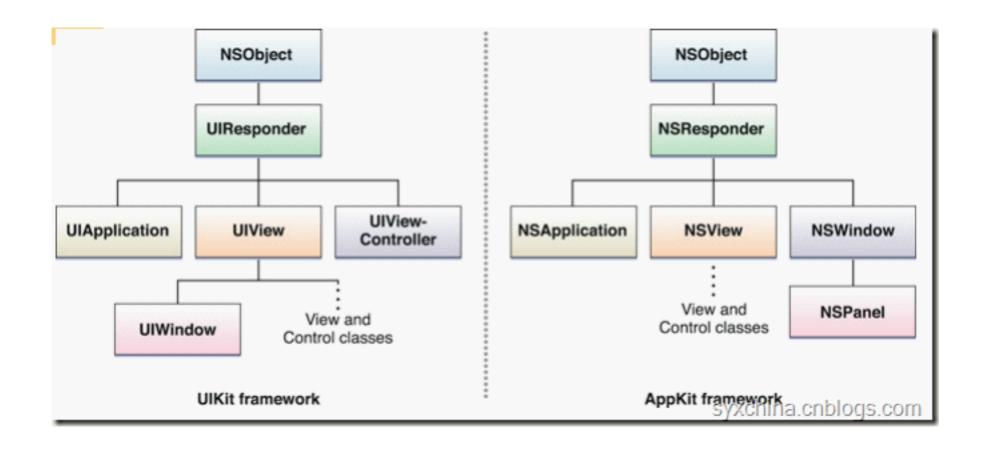

#### Z-order

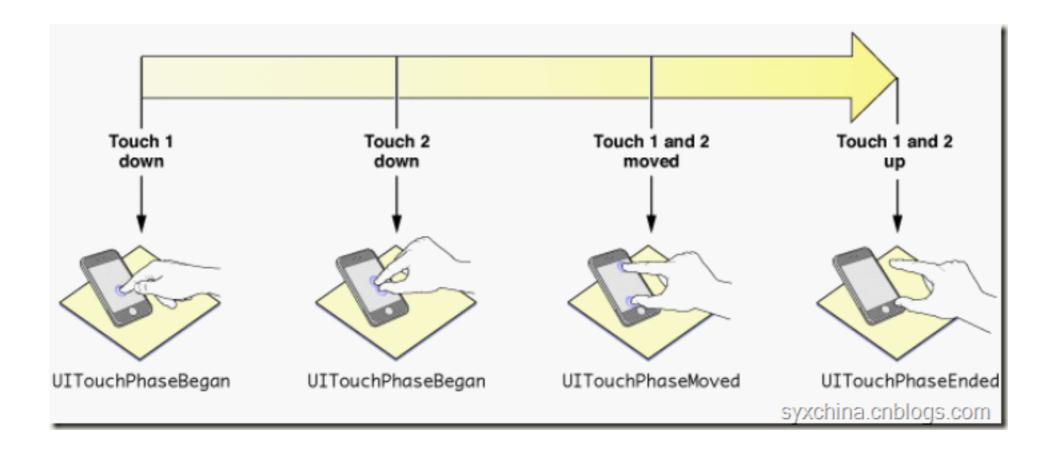

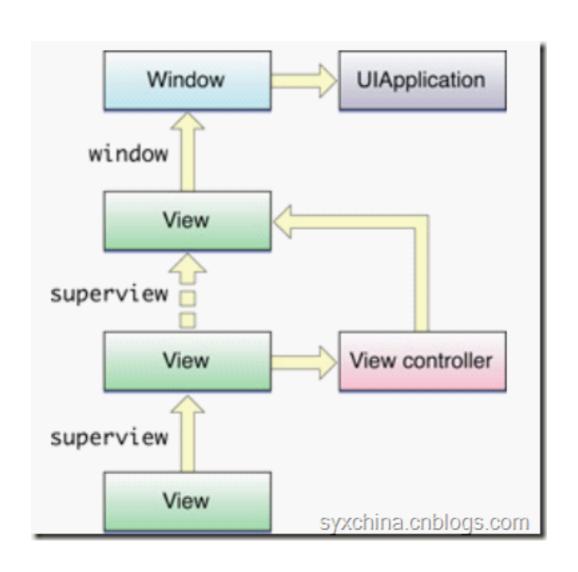

## 响应用户操作

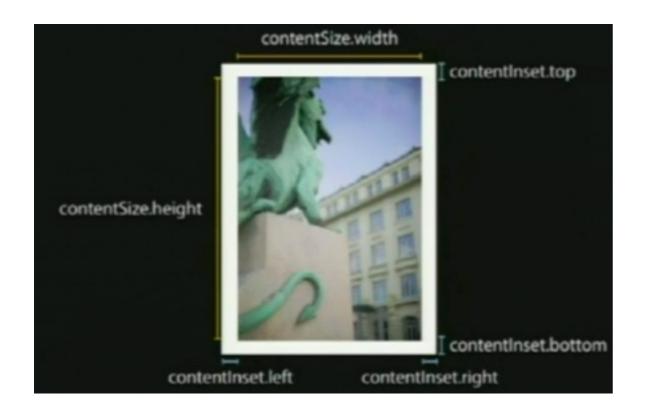

# 触摸事件

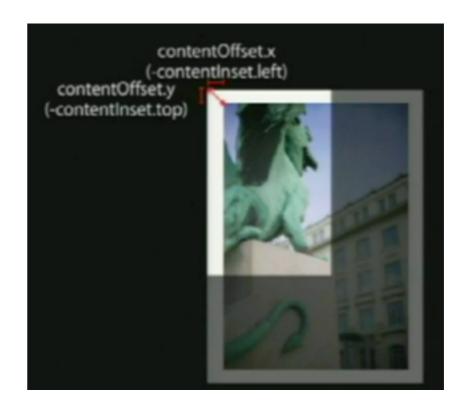

# 事件响应顺序

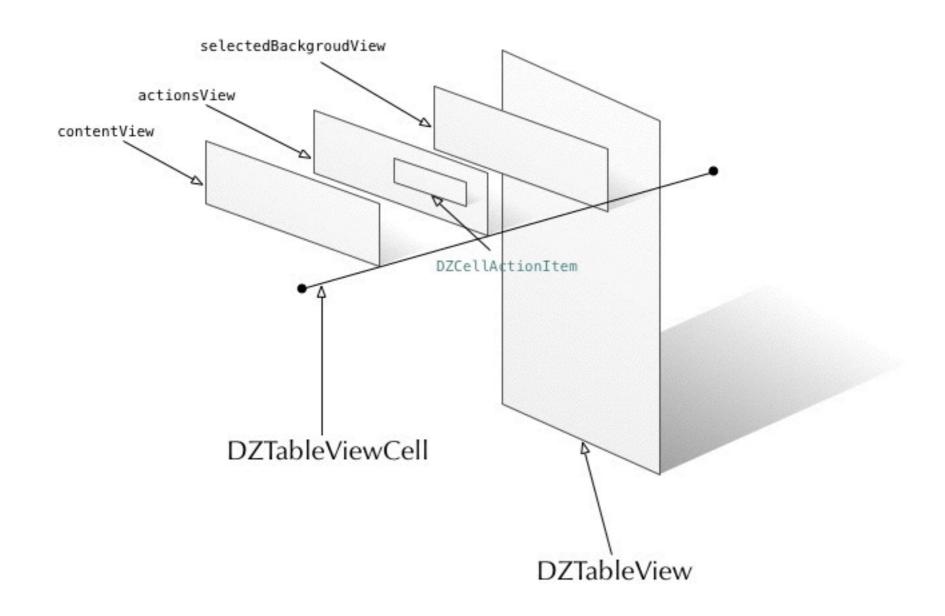

#### **UIScrollView**

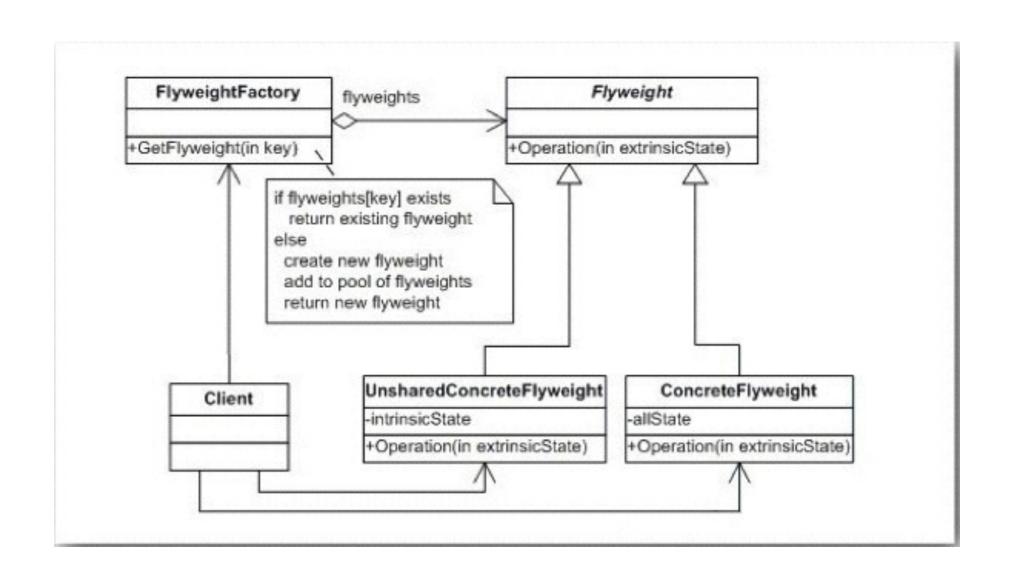

# 子类化UIScrollView实现对Cell的布局

## Cell的重用-享元模式

#### 响应和处理事件

```
- (void) addTapTarget:(id)target selector:(SEL)selecotr
  self.userInteractionEnabled = YES;
  UITapGestureRecognizer* tapGesture = [[UITapGestureRecognizer alloc] initWithTarget:target action:selecotr];
  tapGesture.numberOfTapsRequired = 1;
  tapGesture.numberOfTouchesRequired = 1;
  [self addGestureRecognizer:tapGesture];
[self addTapTarget:self selector:@selector(handleTapGestrue:)];
- (void) handleTapGestrue:(UITapGestureRecognizer*)tapGestrue
  CGPoint point = [tapGestrue locationInView:self];
  NSArray* cells = _visibleCellsMap.allValues;
  for (DZTableViewCell* each in cells) {
    CGRect rect = each.frame;
    if (CGRectContainsPoint(rect, point)) {
       if ([_actionDelegate respondsToSelector:@selector(dzTableView:didTapAtRow:)]) {
         [_actionDelegate dzTableView:self didTapAtRow:each.index];
       each.isSelected = YES;
       _selectedIndex = each.index;
    else
       each.isSelected = NO;
```

#### 在DZTableViewCell上扩展功能

- 0、Cell结构设计
- 1、选中态
- 2、手势与功能
- 3、子类化扩展

视图控制器DZTableViewController

DZTableView的可扩展性探讨

如何实现下来刷新?

我要在最底部加一个固定的Label怎么办?
